

Flare Riser Sections for the PEARL GTL PROJECT

TRANS INTERNATIONAL LOGISTIKS SDN BHD, a new member of GPLN, recently completed the movement of the Flare Riser Sections for the Shell Qatar Pearl GTL Project; the record breaking world's largest GTL project. Comprising 15,000 freight tons, these units were shipped in 8 conventional shipments. Up-to-date, Trans International Logistik has successfully executed and moved 40,000 freight-tons for this project from Malaysia to Qatar.

The highlights of the movement were the Riser Units which measured 23m in length and 4.5m in height and pre-fitted with Insulated-Steam-Lines and Utility-Piping. The fabrication yard being located in the outskirts of Selangor, posed challenging especially

in clearing overhead cables and structures.

Riser Sections at transit yard awaiting arrival of the conventional ship at Port Klang

The quick pace of the project required super-quick deliveries of these sections where transportation ex factory to Port Klang needed to be executed within a few days of the vessel being nominated. The sensi-

Riser Sections enroute from fabricator to Port Klang on multi-axle hydraulic trailer

tivity of the surface of the Riser Units also required special handling techniques where metallic and abrasive equipment could not be used in-order to maintain scratch free handling, transportation and loading of these units.

Proud to say that all deliveries were executed well within the required time frames with zero untoward incidents. ▼
